Declining oil supplies and the environmental impact of coal dictate a switch to renewable energy sources for a sustainable future. Written for a popular audience, *Energy Switch* details this momentous transition and proposes that the remaining non-renewable resources be used to develop a long-term supply of renewable energy.

A renewable energy leader two decades ago, the US now lags behind Germany and Japan. *Energy Switch* pays special attention to Europe's success, especially that of Germany, exploring what can be learned from their experience. It asks whether a mix of renewables is feasible as a major source of energy, at what cost, with what drawbacks, and in what time period. The book examines:

- The shortcomings and benefits of sources that might constitute a largely renewable energy platform: oil, nuclear, coal, biomass, natural gas, wind, PV, geothermal, hydrogen, wave and tidal power
 - Ecological tax reform and tax rebates, quotas and net metering, and the role of privatization
- The success of efficiency measures, the vision of demand management — tailoring power consumption to intermittent supply — and the phenomenon of virtual power plants
- The secret of success being in attitudes and policies, rather than in technology
- How the US could once again become a renewable energy leader

Craig Morris is a journalist and translator specializing in renewable energy. The author of a book in German that presents the rationale behind Germany's turn to renewable energy, he writes on energy policies and lives in Freiburg, Germany's solar capital.
